

People: Gurminder Singh Institution: Naval Postgraduate School
Project : PIM for Mobility

What?

To support mobile workers, the scope of PIM needs to be expanded to include functions that enable the user to receive urgent information on an available platform and in a convenient fashion.

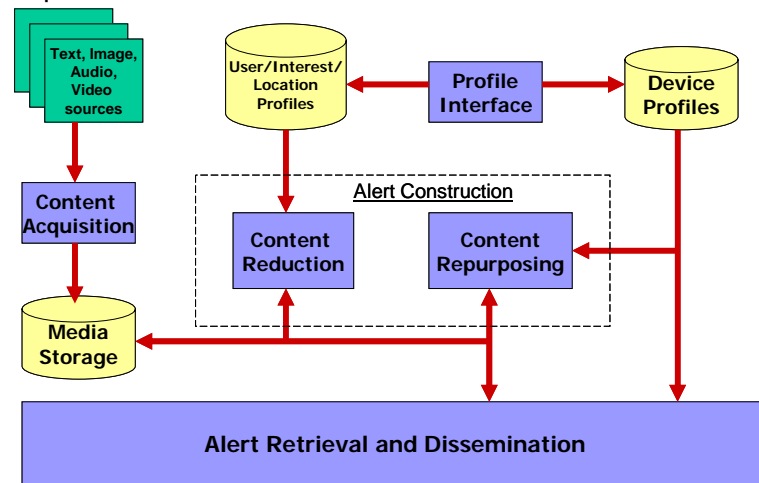

Results so far:

User's calendar contains valuable information about his context – date, time, place, and type of meeting. This, supplemented by user's profile and information value indicators can be used to develop a rather useful system.

Why?

Mobile users have limited computing, networking and attention resources. Without careful management of information, all these could be overwhelmed easily.

Graphic:

How?

Understand user's context, filter information based on his requirements, package the filtered information for delivery based on his device, and then deliver it.
